

## Push newly updated code changes to GitHub

- ❖ check which files have changed:
  - `git status`
- ❖ If everything looks good, **stage** all changed files:
  - `git add .`
- ❖ Or, if you want to **add only specific files**, use:
  - `git add app.py requirements.txt .gitignore`
- ❖ Now, commit the staged files with a meaningful message:
  - `git commit -m "Updated project structure, cleaned up venv, and updated requirements.txt"`
- ❖ Now, push your updates to the GitHub repository. If you're on the main branch:
  - `git push origin main`
